Part A: Correct Use of AI

Artificial intelligence is a useful resource for many college students, however, this powerful tool can easily be misused and cause long-term learning deficiencies. When used correctly, AI can benefit the average student in many ways. AI is a powerful tool that can quickly organize information, help explain confusing topics, and create a learning environment that is specific to the user. For example, a college student that is struggling with following the curriculum of their BIOL 112 class can use AI to organize the chapters and information into a logical and easier to study format. This student could also use AI to create practice exams and study guides that still challenge the student to solve problems independently.

ChatGPT Response -Part A

AI Used: ChatGPT by OpenAI

I agree with your perspective on the correct use of artificial intelligence in college. You make a strong point that AI should be used to support students' learning rather than replace their individual efforts. Your BIOL 112 example demonstrates how AI can help students organize difficult material, create study guides, and develop practice exams while still encouraging independent thinking. I also agree that personalized learning is one of AI's greatest benefits because students can receive explanations tailored to their individual needs. One additional consideration is that students should verify information provided by AI and follow their professors' academic integrity policies. Overall, your paragraph effectively explains how AI can improve learning when used responsibly and ethically.

Part B: Incorrect use of AI

Artificial intelligence can be a powerful tool in college that can quickly explain topics and help students succeed in their education. With this tool being so powerful, it is often abused and can shortcut an individual’s learning. It can be tempting as a college student to use AI to complete worksheets, answer problems, and complete one’s individual work to save time and shortcut around the learning process. Doing this, however, is dishonest and harmful to the students. For example, a student in a BIOL 112 class is crunched for time on his lab report. Instead of drafting and using AI to help him revise his work, he directly uses AI to write his entire report. Not only does this action potentially generate an inaccurate/plagiarized lab report; but this student also now lacks the practice and/or ability to write lab reports efficiently.

ChatGPT response- Part B

agree with your reasoning about the incorrect use of artificial intelligence in college. You accurately explain how relying on AI to complete assignments can negatively affect a student's ability to develop important academic skills. Your BIOL 112 lab report example is especially effective because it shows how using AI to complete an assignment instead of writing it independently can prevent students from developing scientific writing and critical thinking skills. I also agree that submitting AI-generated work as one's own without permission or proper acknowledgment raises serious academic integrity concerns. One additional point to consider is that AI-generated information can contain errors or fabricated sources, which could make an assignment inaccurate. Overall, your paragraph clearly demonstrates why AI should be used as a learning resource rather than as a shortcut to completing academic work.
